#### Scientific Life

#### A solution for breaking the language barrier

Rassim Khelifa<sup>1,2,3,8,\*</sup>, Tatsuya Amano<sup>4,5</sup> and Martin A. Nuñez<sup>6,7</sup>

Global problems require global scientific solutions, but the dominance of the English language creates a large barrier for many non-English-proficient researchers to make their findings and knowledge accessible globally. Here, we propose integrating peer language

and disseminate their research, impeding the contribution of non-native English speakers to addressing global challenges that require a global perspective. The language barrier also hinders many non-native English-speaking researchers from obtaining essential scientific knowledge [5], posing major obstacles to their career development [6,7]. Nevertheless, scientific communities rarely provide genuine support for non-native English speakers [8]. While recent calls have highlighted the need for urgent measures to increase the representation of non-native English-speaking scientists and to solve inequalities driven by the monolingual system [9–11], we still lack viable long-term solutions to

texts. Although there have been some initiatives from some journals to address the language barrier for authors (e.g., buddy/mentoring systems, abstracts and/or main texts in non-English languages in journals such as *Biotropica*, *Nature*, *PLoS Biology*, and *Biological Conservation*), there have been few centralized systems that allow English-proficient researchers to provide peer language proofing to non-English speaking researchers while receiving recognition for their services.

**Peer language proofing in preprint repositories**  
Preprints repositories, such as bioRxiv, have revolutionized scientific research

## 英語論文の執筆

non-native English speakers. Our survey demonstrates that non-native English speakers, especially early in their careers, require more time and effort than native English speakers in conducting scientific activities in English, which includes from reading and writing papers, in English and preparing English presentations, and even for disseminating research in multiple languages. Language barriers can also cause non-native English speakers to not attend or give oral presentations at international conferences conducted in English. We urge scientific communities to recognise and tackle these disadvantages uncovered in this study to guarantee a fair participation in science for release the untapped potential of under-represented non-native English speakers in science.

Unlocking the valuable participation the untapped potential of under-represented researchers sources is one of the urgent challenges in science. Collaboration involving a diverse group of people can decentralize science from traditional hubs of power to better solve problems (1) and deliver higher levels of scientific innovation, and (2) increase its reach and impacts by proposing (3) resulting in better solutions for a wider range of scientific and societal problems. Increasingly (4) today, the effort from under-represented communities to show the need to tap into a diversity of people, views, knowledge systems, and solutions in order to successfully address global challenges, such as the biodiversity and climate crises (4-6), is being increasingly recognised, and it is clear that there is a critical need to do so across multiple disciplines is clear (7-9).

Increasing the diversity within scientific communities requires breaking down the barriers that impede the career development of under-represented groups of researchers, and one such barrier is rooted in language. Although the use of English as the common language of science has no doubt contributed to

### Box 1. Strategies for and challenges in synthesising non-English-language literature

Searching effectively and understanding non-English-language literature can be a challenging task, with the lack of relevant language skills often being a key reason for excluding non-English-language literature in evidence synthesis [8]. Here, we summarise how we can practically synthesise non-English-language literature under such restrictions.

#### How to choose languages

Including more languages would make a synthesis more comprehensive, but given that

### Abstract

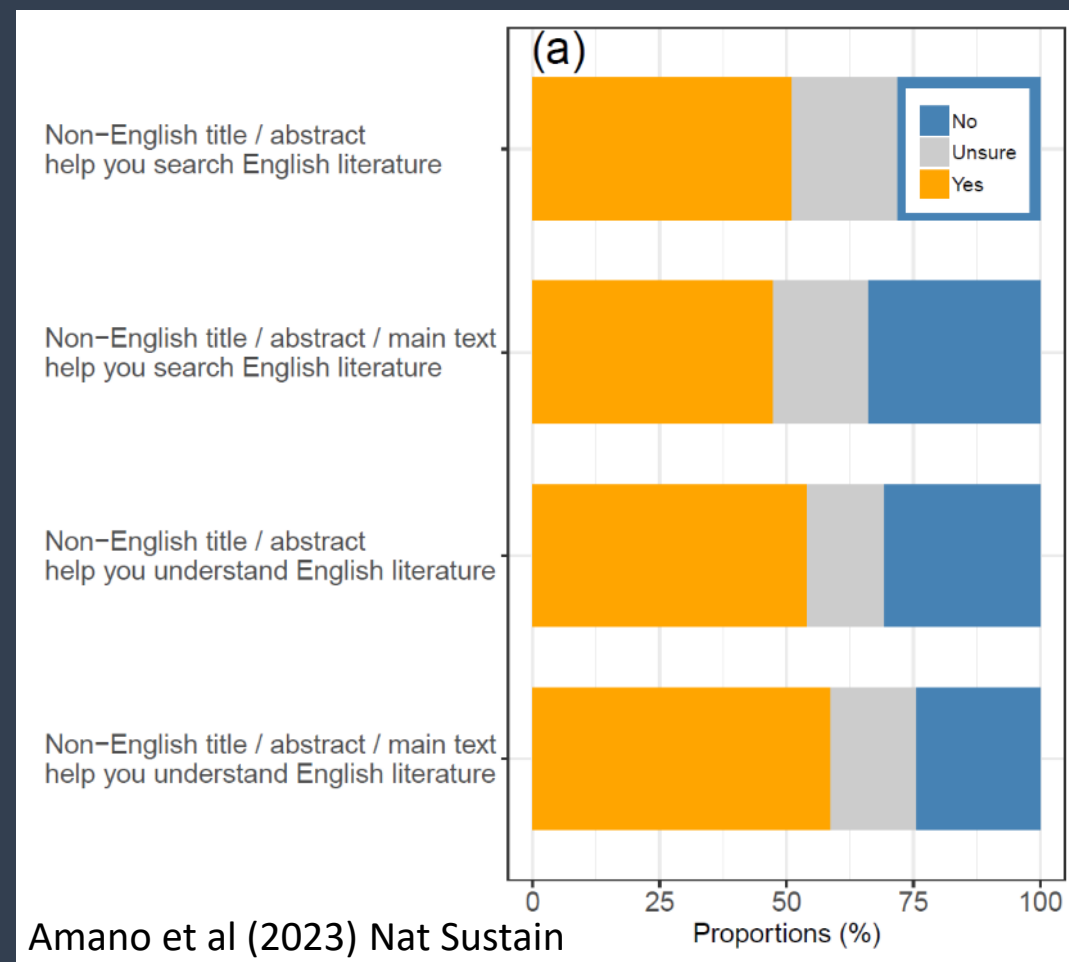

EN ES DE **JA** ZH-HANT PT FR

エビデンスに基づいた保全と生態系管理を促進するための次世代教育

1. 生物多様性をより効果的に保全していくために、次世代の実務者はエビデンスに基づいた意思決定の方法とエビデンスを統合することの価値を深く理解し、また批判的な思考を備える必要がある。

2. 生物多様性保全に関する教育課程においてこの課題を取り扱わなければ、現在の学生が今後の保全活動に対して効果的な貢献を行うようにはならないだろう。

生物多様性に関する国レベルの報告書の著者の約半数が、英語以外の言語の論文タイトルと要旨があると内容の理解に助かると回答

# 研究者に対する**英語の壁**に学界全体で取り組む

## 国際保全生物学会議 2025 理念表明

ICCB2025 では英語が共通言語として用いられることとなります。しかし、英語以外の多くの言語でも生物多様性保全が実践され、情報がやり取りされていることを踏まえ、本大会にはあらゆる言語的背景を持つ方々に是非参加していただきたいと考えています。特に第一言語が英語でない人の場合、国際学会の参加と聞くと気後れしてしまうかもしれません。そこで **ICCB2025** では、**参加者に対する言葉の壁を最小限にすることに注力しています**。現在、多様な言語的背景をもつ参加者をどのようにサポートすることができるか検討中で、多様なコミュニティに対する私たちのコミットメントを共有し、紹介できることを楽しみにしています。

## British Ecological Society integrates Writefull into submission system

**The British Ecological Society, the oldest ecological society in the world, has integrated Writefull into its manuscript submission system. Submitting authors can now use Writefull's language revision free of charge. The British Ecological Society joins other publishers, such as Hindawi, Cambridge University Press, and Karger, in an effort to reduce the language barrier for authors.**

Authors who are submitting their manuscript are invited to use Writefull Revise, a web app where they can upload their document, and download a revised version with Writefull's language edits in Track Changes. The language suggestions, provided by Writefull's language models, are tailored to research writing.

Through this integration, the British Ecological Society offers language and writing support to all authors who may need it. As the Society writes: "The expectation for authors to publish in English can be a significant barrier for researchers whose native language is not English. It can also lead to significantly longer times in peer review if Editors also have to return papers to authors where the language isn't of the required

## Springer Nature introduces Curie, its AI-powered scientific writing assistant

London | Berlin | New York, 13th October 2023

Springer Nature today announced a new AI-powered in-house writing assistant to support researchers, particularly those whose first language is not English, in their scientific writing.

Global research shows that it takes non-native English speaking scientists 51% more time to write a paper (1). This creates an unequal divide in research, limiting the advancement of knowledge and impacting the submission of high quality research from across the globe.

*Curie* is our response. It has been specifically trained on academic literature, spanning 447+ areas of study, more than 2,000 field-specific topics and on over 1 million edits on papers published including those in leading Nature journals. It combines the power of large language models (LLMs) with specialised AI digital editing developed in-house and designed specifically for scientific writing. Unlike generalist AI writing apps, *Curie* focuses on the unique pain points of researchers in their professional writing, including translation to English and English language editing to address grammatical errors and improve phrasing and word choice.

When the service was trialed with researchers in China publishing in *Scientific Reports* and the *Discover Series*, of the 67% of authors who used the tool, 90% subsequently saw their manuscript proceed to peer review, with a 14% increase in articles published at the end of the trial (2).

Eugenie Regan, Vice President, Research Solutions at Springer Nature said:

"By evolving our digital experiences to meet the needs of, and support all researchers, we can save them time, enabling them to focus their efforts where they can have the biggest impact - on the groundbreaking research that advances knowledge and propels society forward."

## EDITORIAL

### ChatGPT is fun, but not an author

In less than 2 months, the artificial intelligence (AI) program ChatGPT has become a cultural sensation. It is freely accessible through a web portal created by the tool's developer, OpenAI. The program—which automatically creates text based on written prompts—is so popular that it's likely to be "at capacity right now" if you attempt to use it. When you do get through, ChatGPT provides endless entertainment. I asked it to rewrite the first scene of the classic American play *Death of a Salesman*, but to feature Princess Elsa from the animated movie *Frozen* as the main character instead of Willy Loman. The output was an amusing conversation in which Elsa—who has come home from a tough day of selling—is told by her son Happy, "Come on, Mom. You're Elsa from *Frozen*. You have ice powers and you're a queen. You're unstoppable." Mash-ups like this are certainly fun, but there are serious implications for generative AI programs like ChatGPT in science and academia.

ChatGPT (Generative Pre-trained Transformer) was developed with a technique called Reinforcement Learning from Human Feedback to train the language model, enabling it to be very conversational. Nevertheless, as the website states, "ChatGPT sometimes writes plausible-sounding but incorrect or nonsensical answers." Several examples show glaring mistakes that it can make, including referencing a scientific study that does not exist.

Many concerns relate to how ChatGPT will change education. It certainly can write essays about a range of topics. I gave it both an exam and a final project that I had assigned students in a class I taught on science denial at George Washington University. It did well finding factual answers, but the scholarly writing still has a long way to go. If anything, the implications for education may push academics to rethink their courses in innovative ways and give assignments that aren't easily solved by AI. That could be for the best.

More worrisome are the effects of ChatGPT on writing scientific papers. In a recent study, abstracts created by ChatGPT were submitted to academic reviewers, who

only caught 63% of these fakes. That's a lot of AI-generated text that could find its way into the literature soon.

For years, authors at the *Science* family of journals have signed a license certifying that "the Work is an *original*" (italics added). For the *Science* journals, the word "original" is enough to signal that text written by ChatGPT is not acceptable: It is, after all, plagiarized from ChatGPT. Further, our authors certify that they themselves are accountable for the research in the paper. Still, to make matters explicit, we are now updating our license and Editorial Policies to specify that text generated by ChatGPT (or any other AI tools) cannot be used in the work, nor can figures, images, or graphics be the products of such tools. And an AI program cannot be an author. A violation of these policies will constitute scientific misconduct no different from altered images or plagiarism of existing works. Of course, there are many legitimate data sets (not the text of a paper) that are intentionally generated by AI in research papers, and these are not covered by this change.

Most instances of scientific misconduct that the *Science* journals deal with occur because of an inadequate amount of human attention. Shortcuts are taken by using image manipulation programs such as Photoshop or by copying text from other sources. Altered images and copied text may go unnoticed because they receive too little scrutiny from each of the authors. On our end, errors happen when editors and reviewers don't listen to their inner skeptic or when we fail to focus sharply on the details. At a time when trust in science is eroding, it's important for scientists to recommit to careful and meticulous attention to details.

The scientific record is ultimately one of the human endeavor of struggling with important questions. Machines play an important role, but as tools for the people posing the hypotheses, designing the experiments, and making sense of the results. Ultimately the product must come from—and be expressed by—the wonderful computer in our heads.

## AI tools can improve equity in science

In his Editorial “ChatGPT is fun, but not an author” (27 January, p. 313), Editor-in-Chief H. H. Thorp describes *Science’s* position on using artificial intelligence (AI) in scientific papers. The updated policy essentially bans the use of text generated from AI, machine learning, or similar algorithmic tools in articles. However, Thorp overlooks the potential of AI tools to improve equity in science by alleviating linguistic disparities.

Research has shown that nonnative English speakers need to invest much more effort than native English speakers when writing papers in English (1). Journals are more likely to reject or request revisions

SCIENCE science.org

Berdejo-Espinola & Amano (2023) *Science*

before acceptance of papers written by nonnative English speakers (2, 3). Human English translation and editing services are costly and time-consuming (4), creating a profound disadvantage for the career development and fair participation of nonnative English speakers in science.

Emerging AI tools, such as ChatGPT and DeepL, can proofread English text with high accuracy (5, 6). The availability of quality, free (or affordable) English editing presents an opportunity for nonnative English speakers, especially those in low-income countries, who often cannot afford to use human English editing services (1, 4). Reducing the technical and financial burden of editing and proofreading papers for nonnative English speakers would be a substantial step toward achieving equity in science.

Our relationship with AI should be a partnership, not a competition. Journal policies should allow authors to use AI tools to edit and proofread their manuscripts. Journal editors can ensure that humans wrote the original text by using the detection tools available [e.g., (7)]. In addition, they can request that authors declare the use of AI tools, as *Nature* does (8), or submit the original version as well as the AI-edited version of the manuscript for full transparency. Regardless of whether they use AI tools, authors will always be responsible for the language used and the content in their final text.

## Change to policy on the use of generative AI and large language models

16 NOV 2023 • 2:00 PM ET • BY H. HOLDEN THORP, AND VALDA VINSON • 2 MIN READ

The adoption of ChatGPT and related large language models to support research and generate scholarly content continues to accelerate. The policy for the *Science* family of journals has been that the use of these tools in research is acceptable as long as proper disclosure appears in the methods section. However, we initially took a **very restrictive stance** regarding the use of ChatGPT in preparing text and figures while monitoring thoughts and responses across the broad scientific community. As we said earlier this year, “... we believe it is prudent to wait until we have more clarity on what uses the scientific community will see as permissible.”

Artificial intelligence (AI). .... **Authors who use AI-assisted technologies** as components of their research study or **as aids in the writing or presentation of the manuscript should note this in the cover letter and in the acknowledgments section** of the manuscript. Detailed information should be provided in the methods section: The full prompt used in the production of the work, as well as the AI tool and its version, should be disclosed. Authors are accountable for the accuracy of the work and for ensuring that there is no plagiarism.

## Ten tips for overcoming language barriers in science

1. Disseminate research in multiple languages
2. Use scientific knowledge sourced from multiple languages
3. Increase the visibility of non-English-language science
4. Translate scientific terms
5. Provide genuine support to non-native speakers
6. Distinguish language skills from scientific quality
7. Consider language balance in scientific activities
8. Acknowledge efforts to overcome language barriers
9. Be considerate of non-native speakers
10. Make use of existing resources and opportunities
